ABSTRACT

A surgical cutting tool including a first jaw and a second jaw
operably associate with the first jaw such that the first jaw
and the second jaw are movable relative to one another
between an opened position and a closed position. A cutting
member is movably attached to the first jaw so that the
cutting member extends from the first jaw towards the
second jaw, and an actuating mechanism is operably asso-
ciated with the cutting member so as to cause the cutting
member to move relative to the first jaw.
